## Answers

- Does the amount of water on Earth change? Explain your answer.
   The Earth always has the same amount of water and it moves through a cycle.
- 2. List the four stages of the water cycle.
  - 1. Accumulation
  - 2. Evaporation
  - 3. Condensation
  - 4. Precipitation
- 3. Describe an example of evaporation you might see at home **Example answer: You can see evaporation by finding a puddle near your home after a rainstorm. As time passes, you will see that the puddle get smaller. This is because the water is evaporating.**
- 4. What happens after water vapour is in the air?
  When water vapour is in the air, it cools and becomes liquid again.
  These water droplets form clouds.
- 5. How does the Sun help the water cycle?

  The Sun helps in the water cycle by heating water so that it becomes water vapour, which helps the cycle continue moving.
- 6. Explain precipitation in your own words.

  Example answer: When water condenses in the air, it becomes heavy and falls back to the Earth as rain, sleet, hail or snow.
- 7. Find and copy a phrase that tells you the Sun is important to the water cycle.
  - Without the Sun, there would be no water cycle.
- 8. What role do oceans play in the water cycle? Explain your answer using evidence from the text.
  - Oceans are the largest water accumulations because they hold 97 percent of the Earth's water.
